

BENEFITS OF SOIL TESTING

Getting a soil test grants you the knowledge to maximize pasture health, allowing you to produce better quality livestock.

Soil tests determine nutrient levels and pH of soil. Armed with this information, farmers can define exact quantity and type of fertilizer to improve soil on the farm.

Fertilizer applications will be based on soil test results, allowing you to maximize crop yields. 60% of crop yields depend on soil fertility.

Soil testing is inexpensive and will tell you the exact amount of lime and fertilizer needed. This will create bigger, faster growing plants, hay and pasture fields, and more.
